Abstract

In the frame of LIFE Andros Park project, a thorough investigation of plants and fungi associated to the alder forests, especially the priority habitat 91E0*, of Andros Island was performed. A large number of plants and fungi were collected and identified and a total of 489 specimens (219 plant and 270 fungi specimens) were labelled and officially deposited at the Herbarium (ACA) and Fungarium (ACAM) of the Agricultural University of Athens. This is the largest collection of plants and fungi associated with *Alnus* forests in Greece, and constitute a significant contribution to the knowledge and documentation of the *Alnus* forests diversity in Europe.

Action C.3

Deliverable titled: “Checklist of the Herbarium/Fungarium specimens of all plant and associated fungal taxa from the target habitat deposited at the ACA and ACAM”

Introduction

Plants

Plant collections in the frame of LIFE Andros Park Project were mainly performed during 2018. The alluvial alder stands of Vori and Lefka were the main target areas, but adjacent areas with different vegetation cover (i.e., phrygana, macchie and sand-dunes) were also sampled. The collected plant material was dried, disinfected through deep freezing, and identified using standard identification keys provided by Flora Europaea (Tutin et al. 1964-1980), Flora Hellenica I, II (Strid & Tan 1997, 2002), and the Atlas of the Aegean Flora (Strid 2016). Plant nomenclature follows Dimopoulos et al. (2013, 2016). Selected specimens were deposited at the Herbarium ACA, Laboratory of Systematic Botany, Agricultural University of Athens.

A total of 219 plant specimens from the alder forests of Andros have been deposited in ACA. In the following Table (Table 1) a comprehensive list of all deposited specimens is presented, including data on the collection date, herbarium code, and collection locality of each specimen.

Table 1. List of the plant specimens from the target habitat and neighboring areas deposited at Herbarium ACA, Laboratory of Systematic Botany, Agricultural University of Athens.

a/a	Taxon name	Family	Herbarium code	Collection date	Locality
1	<i>Acer sempervirens</i> L.	Aceraceae	509-012131	28.05.2018	Lefka

Fungi

In the frame of LIFE Andros Park project, a thorough investigation was performed focusing on the diversity of macrofungi occurring in river banks, springs and alluvial forests within the priority habitat 91E0* as well as in adjacent areas in the valleys and estuaries of Lefka and Vori. This research was completed by collecting of a large number of mushroom-specimens that have been successively dried, disinfected through deep freezing and deposited in the fungal collection of exsiccatae (“Fungarium ACAM”) at the Laboratory of General and Agricultural Microbiology of the Agricultural University of Athens (LGAM-AUA). In some cases, a pure culture was obtained from the living specimens and these living cultures are also maintained in the facilities of LGAM-AUA (please see relevant Deliverable of Action C.3).

Thus, a total number of 270 specimens from this particular priority habitat are now officially deposited in the Fungarium ACAM, of which 200 were collected during the implementation of LIFE Andros Park project. All these dried specimens were thoroughly studied with various methods (including light microscopy and DNA-sequencing) and their taxonomic identity was assessed to the species level for the majority of cases; hence, an inventory comprising 136 species of basidiomycetes was established. Among them, 112 were more or less associated with alder trees, including ectomycorrhizal, wood and litter/humus saprotrophic species. The majority of findings were included in a scientific paper published in June 2020 (Diversity 12, 232; doi:10.3390/d12060232). As regards to the still unidentified (to species level) specimens, our preliminary sequencing results show that some of them may represent new species to science, and their phylogenetic study is currently under way.

In conclusion, this investigation constitutes the first and only scientific work that have ever been performed in Greece focusing to the diversity of *Alnus*-associated macrofungi. In particular, the respective collection of dried specimens is by far the largest existing in the country, thus largely contributing to the knowledge about fungi existing in alder forests of Europe.

In the following Table (Table 2) all respective specimens are listed by being grouped in four major categories pertaining to their ecological status. Specimens that have not been identified to the species level are also included. In the last column, a note is provided indicating either the specimens processed for DNA-sequencing (in this case the respective accession number from GenBank is

quoted), or those from which a pure culture was obtained. Species indicated with an asterisk were recorded for the first time in Greece as reported in the previously referred scientific publication.

Table 2. List of the fungal specimens (from taxa associated to the target habitat) deposited at Fungarium ACAM, Laboratory of General and Agricultural Microbiology, Agricultural University of Athens.

a/a	Taxon name	Fungarium code	Collection Date	Locality (Andros)	Notes (GenBank codes are provided for most of the material sequenced)
